

How to close a quick release wheel skewer - the right way:

CLOSED

OPEN

Quick release skewers close with a **lever** - this lever operates a **cam** that clamps the wheel to the bike's frame (or fork).

To secure your wheel, swing the **lever** to the closed position, as shown here. It may require some force to close, but it should not be difficult.

Do NOT use the lever as a wingnut.

If the lever is almost impossibly tight - or loose - you must rotate the **nut** on the other side of the quick release.

Loosen the **nut** to help the **lever** close easily. Tighten it to make the **lever** clamp with more force.

Continue adjusting the **nut** until the **lever** closes firmly, but comfortably.
